Planned development path

01 / EXECUTIVE SNAPSHOT

A simple token foundation with a clear next chapter

The current BABY COIN design is intentionally narrow: fixed supply, predictable transfers, public technical disclosure, and a roadmap that separates the token from future applications.

NETWORK	TOKEN	SUPPLY	TAX
BNB Smart Chain Chain ID 56	BABY COIN BEP-20 / 18 decimals	21,000,000 BABY Fixed at deployment	0% Buy / sell / transfer

Project identity

Name: BABY COIN
Ticker: BABY
Founder & Project Lead: Mohsen Orak
Website: babycoin1.com

Current foundation

The token is deployed, the source is published and verified on BscScan, and the official asset repository is public. Phase 1 covers the foundation and transparent market infrastructure. Phase 2 is planned gaming development.

READING RULE

On-chain evidence, verified source code, public transaction history, and published links take priority over promotional graphics or third-party displays. This document does not claim a live game, active liquidity, guaranteed listings, or financial returns.

Planned development path

02 / VISION & PRINCIPLES

Build trust first, then build utility

BABY COIN is positioned as a community-focused meme token with a disciplined route toward future gaming experiences. The project treats transparency and product delivery as prerequisites for long-term participation.

PROJECT VISION

Create a recognizable, community-led digital brand that can grow from a straightforward token into enjoyable, responsible, and clearly documented gaming experiences.

01 Simplicity

Keep the base token contract narrow and understandable.

02 Transparency

Publish addresses, source, metadata, and evidence for material claims.

03 Predictability

No dynamic taxes, rebases, emissions, or hidden transfer mechanics.

04 Separation

Future games and services should be separate, disclosed products.

05 Community input

Use feedback, testing, and open progress updates to shape priorities.

06 Responsible utility

Introduce utility only when it has a clear user purpose and risk review.

SCOPE BOUNDARY

The deployed BABY token remains the foundation. A future game, reward service, marketplace, or digital item system may use separate applications or contracts. Any new component should publish its own address, rules, permissions, and security assumptions before users are asked to interact with it.

PHASE 2 / GAMING

Planned development path

03 / TOKEN MODEL

Fixed supply, visible genesis, no embedded emissions

The token model is designed to make the core economics easy to inspect. The contract does not contain a hidden allocation engine, automatic yield mechanism, or privileged mint path.

PARAMETER	DECLARED DESIGN	WHAT USERS SHOULD VERIFY
Total supply	21,000,000 BABY, fixed at deployment.	The contract has no public or privileged mint function.
Genesis allocation	The constructor credited the full initial supply to the deployer address.	Subsequent transfers and current holder distribution are visible on-chain.
Transfer behavior	0% buy, sell, and transfer tax in the token logic.	Verify the exact contract, not a similarly named token.
Emissions	No staking emissions, mining rewards, rebasing, or periodic minting in the token contract.	A future game reward system must be disclosed separately.
Burning	No privileged built-in burn feature. Sending tokens to an unrecoverable address is irreversible.	Burn claims require an observable transaction and destination address.

No sale event in this version

BABY COIN is not presented as having a presale, ICO, IEO, public sale, or launchpad offering. No sale price, fundraising total, or investor allocation is claimed.

Why there is no percentage chart

The token contract has no embedded allocation table, vesting module, or treasury distribution engine. Allocation percentages should be derived from verifiable wallet balances and transaction history rather than invented estimates.

PHASE 2 / GAMING

Planned development path

04 / CONTRACT BEHAVIOR

What the deployed token can and cannot do

The verified source code describes a conventional ERC-20-compatible transfer interface on BNB Smart Chain. The absence of administrative controls is a technical property of the token contract, not a claim that every project operation is decentralized.

STANDARD INTERFACE

balanceOf

transfer

approve

allowance

transferFrom

Transfer / Approval events

No mint

The deployed token does not expose a function to increase supply after genesis.

No tax switch

No owner-only function can introduce or change buy, sell, or transfer fees.

No blacklist

No token-contract control selectively blocks a holder from transferring.

No pause

No global freeze or trading-enable switch is present in the token logic.

No wallet limits

No max-wallet or max-transaction ceiling is imposed by the token contract.

No upgrade proxy

The deployed bytecode cannot be silently replaced by an upgrade administrator.

OPERATIONAL REALITY

No token-contract admin powers does not mean no project operational control. The website, social accounts, liquidity wallets, future games, partnerships, and communication channels may still be managed by people. Any future feature should be delivered as a separately disclosed component rather than by altering the immutable token contract.

PHASE 2 / GAMING

Planned development path

05 / MARKET & METADATA

Market access must be evidenced, not assumed

BABY COIN is transferable on BNB Smart Chain. A market, price, liquidity depth, logo display, or third-party listing exists only when the relevant on-chain or provider evidence is available.

TRANSPARENT MARKET PATH

01 Create Create the intended BABY/WBNB pair on PancakeSwap when funding and operational checks are ready.

02 Publish Publish the pair address, funding transaction, and real buy/sell test evidence.

03 Protect If an LP-lock commitment is made, publish the locker, duration, LP identifier, and transaction.

04 Index Submit consistent metadata to BscScan, wallet registries, DEXScreener, DEXTools, and eligible directories.

STATUS DISCIPLINE

Deployed token **Current**

Verified source **Current**

PancakeSwap pair **Planned / verify**

LP lock **Only claim with evidence**

Listings **Eligibility-based**

Price / liquidity **Not guaranteed**

Wallet display note: a logoURI or public logo file does not guarantee that MetaMask or another wallet will show the image. Wallets and metadata providers use separate registries, caches, and review systems. The contract address remains the canonical identifier.

NEXT UTILITY LAYER

PHASE 2 / GAMING

Planned development path

06 / PHASE 2 GAMING

A planned gaming ecosystem built after the foundation

Phase 2 is the project's next product direction: community-focused gaming experiences connected to the BABY COIN brand. It is planned development, not a claim that a game is already live.

ROADMAP STATUS

PHASE 2 IS PLANNED - NOT YET LAUNCHED

Why gaming

A token alone is a limited product. The gaming direction is intended to give the community a reason to return, participate, compete, create, and test new experiences while keeping the underlying token rules simple.

What Phase 2 may include

Interactive mini-games, community events, quests, leaderboards, creator or partner campaigns, digital rewards, and potential in-game BABY utility. Each feature remains subject to technical, economic, legal, and security review.

PHASE 2 OBJECTIVES

Community first

Design around participation and feedback rather than speculative promises.

Accessible experiences

Favor casual and competitive formats that are understandable to new users.

Optional token utility

Use BABY only where it improves a real game or community experience.

Separate product layer

Keep game logic and permissions separate from the immutable token core.

Evidence at launch

Publish release notes, addresses, rules, and known risks before activation.

No play-to-earn guarantee: any future reward, item, or access design may be limited, experimental, non-financial, or changed after testing. No gaming feature creates a guaranteed BABY price or return.

NEXT UTILITY LAYER

PHASE 2 / GAMING

Planned development path

07 / GAMING DESIGN

Utility should serve the game, not replace it

The proposed architecture keeps the token, game services, and community layer conceptually separate. This lets the project iterate on games without changing the deployed BABY token contract.

TOKEN LAYER

BABY COIN

BEP-20 token, fixed supply, 0% tax

GAME SERVICES

Experiences

Accounts, quests, inventory, scores, events

COMMUNITY LAYER

Participation

Feedback, creators, partners, tournaments

POTENTIAL USE	STATUS	DESIGN INTENT
Event or tournament access	Under evaluation	Use BABY for optional community participation when it adds a clear experience value.
Community challenge rewards	Under evaluation	Rewards may be points, badges, digital items, or BABY; final mechanics must be published first.
Cosmetic or digital items	Future possibility	Prioritize optional expression and gameplay; avoid implying guaranteed resale value.
Partner and creator campaigns	Future possibility	Use transparent campaign rules and identify confirmed partners only.
In-game BABY utility	Not active in v2.0	No game contract, reward schedule, or live integration is claimed by this document.

Implementation principle: when an on-chain action is not necessary, the game may use off-chain services for speed and user experience. When an on-chain action is meaningful, its contract, permissions, fees, and security assumptions should be disclosed before use.

NEXT UTILITY LAYER

PHASE 2 / GAMING

Planned development path

08 / ROADMAP

Milestones with evidence gates

The roadmap communicates direction, not a promise of dates, listings, market performance, or product completion. Each milestone should be marked complete only with public evidence where evidence is technically available.

PHASE 1

FOUNDATION

Foundation & transparent market infrastructure

Deploy and document the token; publish verified source and official assets; maintain the website and repository; establish community channels; create and document market infrastructure only when ready.

PHASE 2

PLANNED

Gaming development

Research game concepts; validate with the community; build prototypes; test selected experiences; define optional BABY utility; review security and operations; release only after the product is ready.

PHASE 3

FUTURE

Conditional ecosystem growth

Expand the game portfolio; explore creator and partner programs; improve analytics and user safety; experiment with community governance where appropriate and clearly documented.

EVIDENCE GATES

A completed milestone should be supported by the relevant public URL, contract address, transaction hash, repository history, release note, test report, or security document. Timing can change when dependencies, funding, testing, third-party reviews, or compliance requirements change.

NEXT UTILITY LAYER

PHASE 2 / GAMING

Planned development path

09 / COMMUNITY & TRANSPARENCY

A public operating model for a growing project

The project can grow responsibly when every important claim has an owner, a source, and a way for the community to verify it.

Community participation

Invite feedback on the roadmap, game concepts, testing priorities, usability, and safety. Community polls and beta testing can inform decisions without being presented as a formal DAO or legal governance system unless one is actually deployed.

Founder and project lead

Mohsen Orak is identified as Founder & Project Lead. External contributors, partners, campaigns, and endorsements should be named only when the relationship is confirmed and its scope is clear.

TRANSPARENCY CHECKLIST

✓ Contract identity

Use the same contract address across the website, documents, metadata, and public posts.

✓ Wallet evidence

Publish the purpose of any official wallet and use on-chain transactions for allocation claims.

✓ Product releases

Document game versions, permissions, reward rules, known issues, and changes before activation.

✓ Security posture

Distinguish verified source code from an independent third-party audit and publish reports when available.

FUNDING AND TREASURY CLARITY

The token contract does not contain an embedded treasury or allocation module. No fundraising total or investor allocation is claimed. If future operations use official wallets, the project should publish their addresses, intended purpose, incoming funding, and material outgoing transactions.

NEXT UTILITY LAYER**PHASE 2 / GAMING**

Planned development path

10 / SECURITY & RISK

Transparency reduces uncertainty; it does not remove risk

The token contract is intentionally simple, but users still face market, wallet, network, application, third-party, and legal risks. Read the following as a practical safety boundary, not as a promise of safety.

Smart-contract risk

Verified source improves inspection but is not the same as an independent audit or formal verification.

Market and liquidity risk

Low liquidity can create slippage, failed quotes, rapid price movement, and uncertain execution.

Wallet and key risk

Anyone with a private key or recovery phrase can control the assets in that wallet.

Third-party risk

Wallets, exchanges, RPCs, analytics sites, metadata providers, and lockers operate independently.

Application risk

A future game or reward service may introduce separate contracts, permissions, bugs, or account risks.

Regulatory risk

Legal, tax, and classification requirements can differ by jurisdiction and user circumstance.

USER SAFETY RULES

- Verify the full contract address before every trade or approval.
- Never share a seed phrase or private key with any person or website.
- Review and revoke token approvals that are no longer needed.
- Check domains carefully before signing wallet messages or transactions.

AUDIT BOUNDARY

This version claims published and verified source code, not a completed independent third-party audit. If an audit or security review is commissioned later, publish the report, scope, date, findings, and resolution status rather than using the word audited without supporting evidence.

11 / DISCLOSURES

Project status and reference links

This final section separates what is documented now from what is planned, so readers can make their own independent checks.

STATUS	ITEMS
Current / documented	BEP-20 token on BNB Smart Chain; symbol BABY; 18 decimals; fixed total supply of 21,000,000 BABY; 0% buy, sell, and transfer tax; deployed contract; published and verified source; official website and asset repository.
Planned / conditional	PancakeSwap market infrastructure and verifiable liquidity evidence; metadata submissions; Phase 2 gaming prototypes, testing, optional utility, partnerships, and later ecosystem expansion.
Not claimed	Guaranteed returns, price support, price predictions, active game, guaranteed listings, guaranteed liquidity, independent audit unless separately published, or legal classification in any jurisdiction.

FINAL STATEMENT

BABY COIN is presented as a transparent fixed-supply token project whose next major direction is planned gaming development. The durable commitment is straightforward: publish the rules, separate facts from plans, avoid hidden token mechanics, and let users verify material claims on-chain.
